

Step 1. Research

Website design prototyping starts with gathering the information. Look at the other sites in your industry (or even outside of it but similar or related to your business in other respects). Most likely, you've visited them a gazillion of times before but as soon as you start planning your own site you will see them through a different lens.

Use this research as a source of inspiration as well as for "what-not-to-do" warning signs to create a website prototype that will be the best fit for your business.

Step 2. Sketch

Now start bringing your ideas to life. You don't need any special art skills or tools for this — just scribble the main elements of your future website pages on a sheet of paper.

Here are the main things to keep in mind when sketching:

- **Sketch out all ideas that come to your head** — even those that seem ridiculous might inspire a good idea once you see it on paper.
- **Make it a fast exercise** — the more you think about it the more likely it is you will get caught up in the details.
- **Annotate** — a lot and everything that comes to your mind about the future page interactions of functionality. The chances are, if you don't write it down this very second, you will forget it at a later stage.

Think of what exactly you want your prototype to demonstrate and make a list of all pages you will need for it.

Perhaps you just want to focus on a path to purchase? Then you will most likely need the following pages: a homepage, search results and/or a category page, a product page, a cart page, a checkout page, and a purchase confirmation page. If you want to build a prototype for a whole website go ahead and list all pages it will feature.

Tadam! The prep job is done, now you are ready to start web page prototyping. It's easy and a lot of fun — that is, if you use a good website prototype builder.

How to choose the best website prototyper?

This is **not an easy decision** given the **number of solutions** available on the market. In this case analysis paralysis is no longer a figure of speech but an accurate description of a user's mind struggling to make a choice. Don't lose your head and see through the marketing clutter.

Unless you are building something extremely complicated, **all you really need is a simple, reliable, and, preferably, free prototyping tool** (like [Mockplus](#) or [Draftium](#)).

If that's the case, Draftium is a **website prototype tool** you might want to check out. It has over 200 website prototype templates, 250+ ready-made blocks for all kinds of page elements you can combine in any way you like, and robust interactive functionality. There is no learning curve due to a user-friendly design.

You can build a website prototype for free using any blocks or you can get one of the pre-designed templates for a small fee. The Draftium prototyping templates have been created by experienced web-designers, are custom-tailored for various industries, niches markets, and types of businesses,
